

COMMUNICATION TO SUPPLIERS

BENACUS S.L.U. has implemented an integrated quality and environmental system.

This document informs the suppliers that make up the supply chain of goods and services of **BENACUS SLU** of the minimum applicable requirements that they must comply with in terms of quality and environmental protection and pollution prevention.

Performance evaluation as a supplier

We evaluate all our suppliers' performance with us on an annual basis based on their compliance with the specifications of the products we order from them, delivery times and services they provide. Based on the results of our inspections, we will calculate the results of their performance as a supplier.

If the results of your annual performance evaluation are not correct, we will inform you so that you can send us a service commitment explaining the actions you are going to implement to correct the causes and reasons that led to your downgrading, so that we can study them and you can be reclassified again.

If the results of their annual performance evaluation are correct, we will automatically keep them on the list of classified suppliers, without any communication from us.

Environmental requirements:

- Comply with applicable environmental legislation and have the regulatory authorisations required to carry out their activity.
- Use the appropriate resources and means to carry out its activity with the least possible environmental impact.
- Carry out selective segregation of the waste generated by its activity, depositing it in the corresponding containers at the clean point.
- Assume responsibility for the management of hazardous waste generated by its activity.
- No uncontrolled discharges.
- To make efficient use of water and energy in the development of its activity.

Significant environmental aspects are included in our management system:

- Consumption of electricity and fuels (diesel)
- Emissions to the Atmosphere (Engine Combustion Fumes)

Our environmental objectives are:

- Use of biodegradable raw materials. Reduction of plastic in 50% of the new articles designed.
- Electricity and Fuel Consumption. Reduction of electricity consumption by 10%.
